Tomorrow's skeleton staff: mesenchymal stem cells and the repair of bone and cartilage.

Stem cells are regenerating medicine. Advances in stem cell biology, and bone marrow-derived **mesenchymal stem cells** in particular, are demonstrating that many clinical options once thought to be science fiction may be attainable as fact. The extra- and intra-cellular...

... and HGF, as well as the complementary roles of Wnt and Dickkopf-1 in stem cell proliferation are evident. The ability to direct multi-lineage **mesenchymal stem cell (MSC)** potential towards an osteogenic phenotype by stimulation with **Menin** and **Shh** are important, as are the modulatory roles of **Notch-1** and **PPARGamma**. Control of chondrocytic differentiation is effected by interplay of **Brachyury**, **BMP-4** and **TGFbeta3**. **Smads 1, 4 and 5** also play a role in these phenotypic expressions. The ability to culture MSC has led to...

The T-box transcription factor Brachyury mediates cartilage development in mesenchymal stem cell line C3H10T1/2.

The BMP2-dependent onset of osteo/chondrogenic differentiation in the acknowledged pluripotent murine **mesenchymal stem cell line** (C3H10T1/2) is accompanied by the immediate upregulation of Fibroblast Growth Factor Receptor 3 (FGFR3) and a delayed response by FGFR2. Forced expression...

... chondrogenic lineage in this cell line. Screening for transcription factors exhibiting a chondrogenic capacity in C3H10T1/2 identified that the T-box containing transcription factor **Brachyury** is upregulated by FGFR3-mediated signaling. Forced expression of **Brachyury** in C3H10T1/2 was sufficient for differentiation into the chondrogenic lineage in vitro and in vivo after transplantation into muscle. A dominant-negative variant of

Brachyury, consisting of its DNA-binding domain (T-box), interferes with BMP2-mediated cartilage formation. These studies indicate that BMP-initiated FGF-signaling induces a novel type of transcription factor for the onset of chondrogenesis in a **mesenchymal stem cell line**. A potential role for this T-box factor in skeletogenesis is further delineated from its expression profile in various skeletal elements such as

Chemical Name: Bone Morphogenetic Proteins; **Brachyury** protein; Proto-Oncogene Proteins; Receptors, Fibroblast Growth Factor; Recombinant Proteins; T-Box Domain Proteins; Transcription Factors; bone morphogenetic protein 2; fibroblast growth factor 3; Fibroblast...

In the sea urchin **embryo**, the oral-aboral axis is specified after
fertilization by mechanisms that are largely unknown. We report that early
sea urchin embryos express Nodal and Antivin in the presumptive oral
ectoderm and demonstrate that these genes control formation of the
oral-aboral axis. **Overexpression** of nodal converted the whole ectoderm
into oral ectoderm and induced ectopic expression of the orally expressed
genes goosecoid, **brachyury**, BMP2/4, and antivin. Conversely, when the
function of Nodal was blocked, by injection of an antisense Morpholino
oligonucleotide or by injection of antivin mRNA...

...axis in a largely non-cell-autonomous manner. These observations suggest

that the mechanisms responsible for patterning the oral-aboral axis of the sea urchin **embryo** may share similarities with mechanisms that pattern the dorsoventral axis of other deuterostomes.

We studied the effects in *Xenopus* embryos of **overexpression** of antisense RNA complementary to the messenger RNA of eFGF. We show that the expression of sense RNA can be severely depressed in the presence...

... a depression of translation of the residual message. The diminution of inducing activity of eFGF, measured in animal cap assays either by activation of the **Brachyury** gene or by morphology, parallels the reduction of translation. Endogenous eFGF expression is reduced to a similar extent, again by a combination of mRNA destruction and inhibition of translation. This shows that the **overexpression** of antisense RNA is, contrary to general opinion, a potentially useful technique for studying gene function in *Xenopus* embryos. However, in the case of eFGF...

... no overall phenotypic effect on whole embryos. This is probably because

of the presence of several other FGFs with overlapping expression domains in the early **embryo**.

... up-regulation of all. Up-regulation of D cyclins occurs through an increase in the steady-state levels of mRNA, concomitantly with the activation of **Brachyury** and Goosecoid, two early markers of mesoderm differentiation. Similarly, cells from the epiblast of the early postimplantation mouse **embryo** do not express any cyclin D/CDK4 complexes. These are progressively upregulated at gastrulation and early organogenesis. DIA/LIF-stimulated ES cells are not growth-arrested by **overexpression** of p16Ink4a, a specific inhibitor of CDK4 and CDK6. We propose that the G1/S transition may be regulated by a minimal mechanism in mouse...

Record type: Completed

The **Brachyury** gene has a critical role in the formation of posterior mesoderm and notochord in vertebrate development. A recent study showed that **Brachyury** is also responsible for the formation of the left-right (L-R) axis in mouse and zebrafish. However, the role of **Brachyury** in L-R axis specification is still elusive. Here, it is demonstrated that

Brachyury is involved in L-R specification of the *Xenopus laevis* **embryo** and regulates expression of Zic3, which controls the L-R specification process. **Overexpression** of *Xenopus* **Brachyury** (Xbra) and dominant-negative type Xbra (Xbra-EnR) altered the orientation of heart and gut looping, concomitant with disturbed laterality of nodal-related 1 (Xnrl ...

... left lateral plate mesoderm. Furthermore, activation of inducible type

Xbra (Xbra-GR) induces Zic3 expression within 20 min. These results suggest that a role of **Brachyury** in L-R specification may be the direct regulation of Zic3 expression.

Gastrulation in the amphibian **embryo** is driven by cells of the mesoderm. One of the genes that confers mesodermal identity in *Xenopus* is **Brachyury** (Xbra), which is required for normal gastrulation movements and ultimately for posterior mesoderm and notochord differentiation in the development of all vertebrates. Xbra is a...

...interference with transcription activation leads to an inhibition of morphogenetic movements during gastrulation. To understand this process, we have screened for downstream target genes of **Brachyury** (Tada, M., Casey, E., Fairclough, L. and Smith, J. C. (1998) Development 125, 3997-4006). This approach has now allowed us to isolate Xwnt11, whose...

...induced in an immediate-early fashion by Xbra and its expression in vivo is abolished by a dominant-interfering form of Xbra, Xbra-En(R).

Overexpression of a dominant-negative form of Xwnt11, like **overexpression** of Xbra-En(R), inhibits convergent extension movements. This inhibition can be rescued by Dsh, a component of the Wnt signalling pathway and also by...

LANGUAGE: English

ABSTRACT: Sea urchin **Brachyury** homolog (HpTa) is expressed exclusively in the vegetal plate and secondary mesenchyme cells in the embryos of sea urchin *Hemicentrotus pulcherrimus*. In order to gain insights into the role of HpTa during sea urchin development, we designed experiments to perturb the embryo by inducing ectopic **overexpression** of HpTa by injecting fertilized eggs with HpTa mRNA. The **overexpression** of HpTa resulted in suppression of the formation of vegetal plate and secondary mesenchyme cells. We assume that the interaction of HpTa with unknown factors...

...amount of HpTa proteins produced from injected HpTa mRNA depletes the co-factors. In consequence, the target genes of HpTa would be repressed by the **overexpression** of HpTa. We suggest that HpTa is involved in the formation of the vegetal plate and the differentiation of secondary mesenchyme cells.

... and can be induced by ectopic goosecoid expression. Maintenance of pitx2c midline expression is dependent on cyclops (nodal) and schmalspur, but not no tail (brachyury). **Ectopic expression** of pitx2 isoforms results in distinct morphological and molecular phenotypes, indicating that pitx2a and pitx2c have divergent regulatory functions. Both isoforms downregulate goosecoid on the...

...ABSTRACT: 289)As-T/lacZ diminished the reporter gene expression. In addition, coinjection of p(-289)As-T/lacZ and synthetic As-T mRNA resulted in **ectopic expression** of lacZ in non-notochord cells, suggesting that the T-binding motif is responsible for autoactivation of the gene. These findings revealed striking differences between...

...ABSTRACT: and/or overexpression of this gene by injecting synthetic mRNA into fertilized eggs. The results showed that the injection of As-T2 mRNA induced an **ectopic expression** of muscle-specific myosin heavy-chain gene and actin gene, especially in presumptive epidermal cells. This ectopic muscle-specific expression was accompanied by the partial suppression of an epidermis-specific gene expression. The overexpression of As-T2, however, rarely affected the expression of As-T (**Brachyury**) and genes that are expressed in the tailbud.

...ABSTRACT: blastopore lip formation at the border between the mesoderm and endoderm. Transcripts encoding brachyury, Xwnt8 and goosecoid colocalize with Xombi transcripts within the marginal zone; **ectopic expression** of Xombi induces expression of all three mesodermal genes. In ectodermal explants, Xombi expression is induced by the secreted mesoderm inducers activinA, activinB, Xnrl and eFGF, and by **brachyury**, another Xenopus T-box containing gene. The time course and location of Xombi expression, its biological activities and the partial dependence of Xombi expression and...

...elevated in DMSO-treated P19(RXR-alpha) and in P19 cells treated simultaneously with retinoic acid and DMSO. The mRNA for the mesoderm inducer protein **Brachyury** T was also deregulated in P19(RXR-alpha) cells and D3 cells compared with that of wild-type P19 cells. Together, these results show that expression of the RXR- alpha mRNA and protein in P19 cells is tightly regulated during the mesodermal/muscle differentiation of P19 cells, and that **ectopic expression** of the RXR-alpha protein prevents differentiation associated with increased cell death, prolonged expression of **Brachyury** T, and constitutive expression of Id1.

The notochord is one of the characteristic features of the phylum Chordata. The vertebrate **Brachyury** gene is known to be essential for the terminal differentiation of chordamesoderm into notochord. In the ascidian, which belongs to the subphylum Urochordata, differentiation of...

...induced at the late phase of the 32-cell stage through cellular interaction with adjacent endoderm cells as well as neighboring notochord cells. The ascidian **Brachyury** gene (As-T) is expressed exclusively in the notochord-lineage blastomeres, and the timing of gene expression at the 64-cell stage precisely coincides with...

...without the induction, of notochord-specific features in the A-line presumptive notochord blastomeres. We also show that overexpression of As-T RNA leads to **ectopic expression** of notochord-specific features in non-notochord lineages, including those of spinal cord and endoderm. These results strongly suggest that the developmental role of the **Brachyury** is conserved throughout chordates in notochord formation.

...specified appropriately. Despite the absence of a morphologically distinct node, sparse axial mesoderm cells in eed mutant embryos are specified, as reflected by expression of **Brachyury** (T), Sonic hedgehog, and Tcf3b/HNF-3beta, and definitive endoderm is produced. Specification of these cell types is also independent of correct expression of nodal, Fgf4, and gsc. Finally, T and Evx1 display **ectopic expression** in cells not normally fated to ingress through the primitive streak. The data presented are discussed in terms of mechanisms for establishment of the eed...

Brachyury (T) mutant embryos are deficient in mesoderm formation and do not complete axial development. The notochord is most strongly affected. The T gene is expressed transiently in primitive streak-derived nascent and migrating mesoderm cells and continuously in the notochord. **Ectopic**

expression of T protein in the animal cap of Xenopus embryos results in ectopic mesoderm formation. The T protein is located in the nucleus. These and...
